Date: November 27, 2023

Abstract

Background. Questionnaire formatting and item order may impact both how respondents interact with a survey and the estimates that the survey produces. Past iterations of the National Center for Injury Prevention and Control's (NCIPC) National Intimate Partner and Sexual Violence Survey (NISVS) have used both interleaved (in 2010—2015) and grouped (in 2016—2017) formatting. Differences in the prevalence of intimate partner violence (IPV) emerged which may be related in part to the divergent question formats.

Methods. NCIPC worked with the National Center for Health Statistics (NCHS)' Collaborating Center for Questionnaire Design and Evaluation Research (CCQDER) to design a round of NCHS' Research and Development Survey (RANDS 5) dedicated to exploring these formatting and order effects. Respondents were randomly assigned into three experimental conditions that differed in both how, and the order in which, the IPV-related questions were administered. This three-way experimental split is designed to allow examination of overall questionnaire formatting and order effects.

Results. Comparative analysis of the prevalence of IPV constructs measured on RANDS 5 (contact sexual violence, stalking, physical violence) across the three experimental conditions showed that when significant differences were observed, the interleaved condition consistently produced lower estimates than the two grouped conditions. Beyond the prevalence of IPV-related behaviors themselves, differences across the three experimental conditions were also revealed in the analysis of data quality metrics—including completion rates, missingness, response latency, and subjective burden. The interleaved format produced less unit non-response and item missingness than the two grouped formats; however, it also led to a higher average response time and greater amounts of subjective burden.

Conclusion: Overall, the prevalence of many IPV-related behaviors and several data quality metrics showed statistically significant differences across the three experimental conditions, particularly between the one condition that used interleaved formatting and the two that used grouped formatting.

Keywords: Intimate partner violence, questionnaire formatting, experimental design, interleaved formatting, grouped formatting, web surveys, commercial survey panels, questionnaire evaluation.

Introduction

The National Center for Injury Prevention and Control (NCIPC) conducts the National Intimate Partner and Sexual Violence Survey (NISVS) to collect information on the prevalence of various types of intimate partner violence (IPV)—or acts of violence conducted by a romantic or sexual partner. NISVS is a vital survey system in CDC’s efforts to track, understand, and prevent acts of IPV. In its recent history, the NISVS questionnaire has used two divergent formats in its attempts to collect IPV data. The 2012 NISVS used a series of rostering and immediate follow-up questions (i.e., an “interleaved” format) to collect detailed information about IPV perpetrators. Conversely, the 2016 NISVS questionnaire used a simplified format wherein a set of screener questions were asked first, followed by a more general series of follow-up questions (a “grouped” format). NCIPC’s analysis of these surveys’ data suggested that differences in the prevalence of IPV found across these two surveys may be due in part to methodological differences instead of (or in addition to) actual changes in the prevalence of the underlying social behaviors. To examine these differences in more detail, NCIPC worked with the National Center for Health Statistics (NCHS) and its Collaborating Center for Questionnaire Design and Evaluation Research (CCQDER) to design and conduct a round of NCHS’ Research and Development Survey (RANDS) that would evaluate these differences.

This report will first provide an overview of the methodology of this evaluation, followed by the evaluation’s findings, and will then conclude with a brief discussion.

Methodology

RANDS

The National Center for Health Statistics’ (NCHS) Research and Development Survey (RANDS) is NCHS’ methodological survey system. The program, which began in 2015, collects data from commercial survey panels to inform the work of NCHS’ Division of Research and Methodology (DRM). This research includes

expanding the methods DRM uses to evaluate survey measurement error, including embedded probes and experimental design, and the development of statistical methodology for the calibration of survey estimates that leverage the strength of national survey data [1] [2] [3] [4]. To this point, ten rounds of RANDS have been completed—seven for strictly methodological research purposes, and three special-purpose “RANDS during COVID-19” rounds that allowed NCHS to quickly release experimental estimates on a limited set of coronavirus- and COVID-19 pandemic-related topics (<https://www.cdc.gov/nchs/covid19/rands.htm>).

All rounds of RANDS are conducted using recruited, probability-based commercial panels (though two of the RANDS during COVID-19 rounds were supplemented with data from non-probability, opt-in commercial panels). Data is collected under the confidentiality protections provided by the Confidential Information Protection and Statistical Efficiency Act (CIPSEA, 44 U.S.C. 3561-3583). Detailed descriptions of the surveys’ methodology and public use files are available on NCHS’ RANDS webpage [5]. Restricted RANDS data are also available via NCHS’ Research Data Center [6].

RANDS 5, the fifth stand-alone iteration of RANDS, was fielded between January and March of 2022 by NORC at the University of Chicago (NORC) for NCHS. The primary goal of RANDS 5 was to examine potential survey design approaches for NCIPC’s NISVS program. Specifically, NCIPC was interested in studying the relative performance of an interleaved rostering approach (similar to what was used in the 2012 NISVS) and a simplified grouped approach with limited follow-ups (similar to what was used in the 2016 NISVS). “Interleaved” and “grouped” formatting refer to the placement of filter or screening items within a survey questionnaire. In interleaved formatting, follow-up questions are administered directly following filter questions; in grouped formatting, follow-up questions follow a series (or “group”) of filter questions [7] [8] [9]. Additionally, NCIPC wanted to study whether items related to physical violence were particularly sensitive, leading to significant order effects within the questionnaire that would cause respondents to drop off or use satisficing behaviors. “Order effects” refer to the phenomenon wherein the order that items are administered in a survey impacts respondents’ response processes [10] [11]. By conducting this evaluation on a single sample from AmeriSpeak, the differences in survey universes and data collection modes that naturally existed between the 2012 and the 2016 iterations of NISVS could be controlled for.

RANDS 5 was administered to a sample of 9,469 panelists from NORC’s AmeriSpeak adult (18+) survey panel using both web (self-report) and telephone interviews. AmeriSpeak is a probability-based, recruited panel of potential survey respondents developed and maintained by NORC. Sampling strata were based on age, race and ethnicity, educational attainment, sex, and household income for a total of 96 strata. 6,896 sample

members completed the survey for a completion rate of 72.8% and a cumulative weighted response rate (which takes into account not only this completion rate, but also the panel recruitment and attrition rates) of 11.1%.

Survey completion mode was determined by panelist preference and was not randomly assigned. When using a panel such as NORC's AmeriSpeak, the inclusion of a sub-sample of phone-preference panelists is one way to decrease the potential coverage bias of the sample. In short, panelists (and thus potential respondents) who do not have access to high-speed internet, or who are not comfortable using internet-connected devices to complete surveys, are expected to have different characteristics and substantive outcomes than those that do have access to or who are comfortable using the internet. However, measurement differences can also be introduced by administering a survey across different modes: the way a respondent perceives and interacts with a survey item can be different if they are reading versus hearing it.

Following data collection, NORC processed the data by removing responses that triggered data-quality checks, including for speeding (those that completed the survey in less than 1/3 of the median duration) and extremely high item non-response (those that skipped or refused more than 50% of the questions for which they were eligible to receive). NORC then produced survey weights for RANDES 5 which account for the sample design and are calibrated to U.S. civilian non-institutionalized adult population counts to account for differential nonresponse and under coverage of some groups on the sample frame. NCHS further adjusted these weights through an additional post-stratification step in which the marginal totals of RANDES were raked to the marginal population totals from the National Health Interview Survey (NHIS, <https://www.cdc.gov/nchs/nhis/index.htm>). This calibration step is designed to bring the RANDES data in line with NCHS' gold standard household health survey and is conducted for each round of RANDES [12] [13] [14]. RANDES 5 was calibrated to the 2020 NHIS sample adult file (n = 31,997) on the following demographic and health characteristics: age, sex, race and Hispanic origin, education, household income, Census region, marital status, ever diagnosed high cholesterol, ever diagnosed asthma, ever diagnosed hypertension, ever diagnosed diabetes, metropolitan status, and phone service. The calibrated weights were proportionally adjusted to the total number of respondents in RANDES 5.

Detailed information regarding the sample, data processing, and weighting used in RANDES 5 is available in Appendix B.

Survey Questionnaire and Experimental Design

The RANDS 5 questionnaire, which is available in Appendix C, included items from both the 2012 and 2016 NISVS surveys [15]. The full 2012 and 2016 NISVS questionnaires were not included; rather subsets of items relating to outcomes of interest—including stalking by an intimate partner, physical violence by an intimate partner, and sexual violence by an intimate partner—were selected for inclusion in RANDS 5. As the general data collection strategies and survey content differed across the 2012 and 2016 NISVS, the calculation of these outcome measures differs by NISVS survey year and are not directly comparable, but rather comparable on a conceptual level.

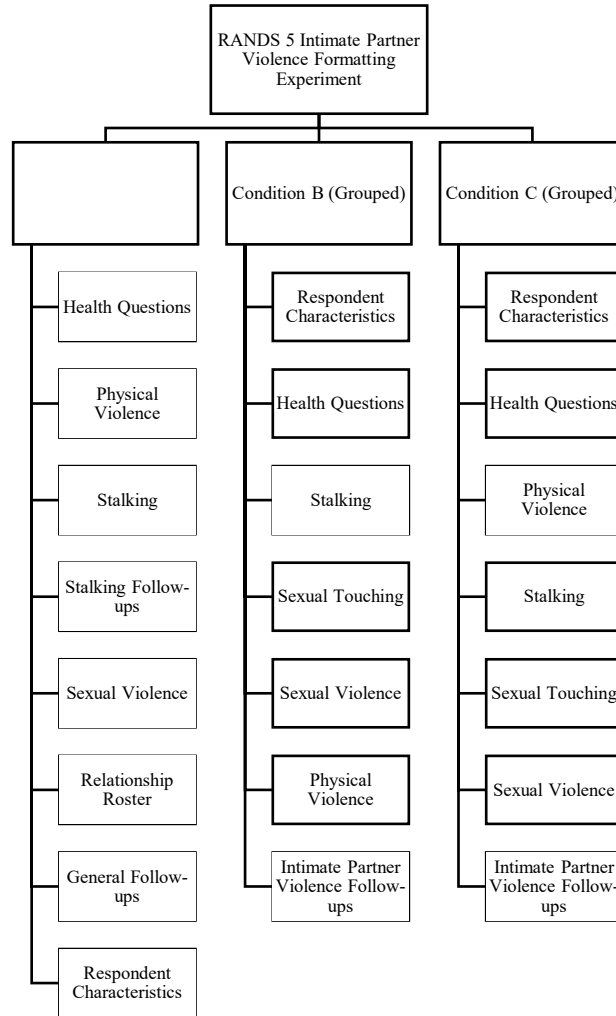

In addition to the NISVS items, the RANDS 5 questionnaire also included a series of NHIS chronic condition questions used for the weighting calibration previously discussed, as well as a series of questions related to gender identity intended for separate methodological work by NCHS.

To examine the performance of the two approaches to collect NISVS data, and to investigate whether sensitive questions provide a negative framing effect, a three-way, split-sample design was implemented in RANDS 5. Sampled panelists were randomly assigned to one of three experimental conditions shown in Table A.

TABLE A: A DESCRIPTION OF THE THREE CONDITIONS USED IN THE RESEARCH AND DEVELOPMENT SURVEY 5 INTIMATE PARTNER VIOLENCE FORMATTING EXPERIMENT.

Experimental Condition	Description
Condition A	A version using interleaved formatting and rosters, akin to the approach used in the 2012 NISVS. The intimate partner violence sections are ordered with physical violence first, followed by stalking and sexual violence. Referred to throughout the report as the "Condition A."
Condition B	A version mainly using grouped formatting and binary yes/no options, akin to the approach used in the 2016 NISVS. The intimate partner violence sections are ordered with stalking first, followed by sexual violence and physical violence. Referred to throughout the report as the "Condition B."
Condition C	A version mainly using grouped formatting and binary yes/no options, akin to the approach used in the 2016 NISVS. The intimate partner violence sections are ordered with physical violence first, followed by stalking and sexual violence. Referred to throughout the report as the "Condition C."
<p>NOTE: NISVS is the National Intimate Partner and Sexual Violence Survey SOURCE: National Center for Health Statistics, 2023</p>	

This design, including the questionnaire orders are shown in the figure below:

NOTES: RANDS 5 is the NCHS Research and Development Survey, Round 5. Experimental Condition A was administered to one third of the sample and used interleaved formatting and rosters to collect intimate partner violence information, akin to the approach used in the 2012 National Intimate Partner and Sexual Violence Survey. Experimental Condition B was administered to one third of the sample and mainly used grouped formatting and rosters to collect intimate partner violence information, akin to the approach used in the 2016 National Intimate Partner and Sexual Violence Survey. Experimental Condition C was administered to one third of the sample and mainly used grouped formatting and rosters to collect intimate partner violence information, akin to the approach used in the 2016 National Intimate Partner and Sexual Violence Survey. Condition C differed from Condition B only in the ordering of the questionnaire sections, with the Physical Violence section administered before the other intimate partner violence sections.

FIGURE A: RESEARCH AND DEVELOPMENT SURVEY ROUND 5 INTIMATE PARTNER VIOLENCE FORMATTING EXPERIMENT DESIGN AND QUESTIONNAIRE SECTION ORDER.

Measurement of Outcome Variables

All three of the RANDES 5 questionnaire versions were designed to measure the same set of intimate partner violence-related constructs, including: contact sexual violence (CSV), stalking, and physical violence (PV). However, the measurement of these constructs differed across the three arms of the RANDES 5 questionnaire experiment (as well as across the 2012/2016 versions of NISVS upon which the experimental conditions were based), and thus the comparisons across Condition A and Conditions B and C are not item-to-item, but rather concept-to-concept.

Contact Sexual Violence

CSV is measured by determining whether a respondent has ever experienced one or more of the following: rape, been made to penetrate (MTP), sexual coercion, and/or unwanted sexual contact.

Rape and MTP

In experimental Condition A, the definitions of rape and MTP are complex, due to the consideration of both the respondent's sex and the perpetrators' gender. The decision matrix for determining whether a respondent had been raped or been made to penetrate is shown in Table B.

TABLE B: OUTCOME DECISION MATRIX FOR RAPE AND MADE-TO-PENETRATE (MTP) CODES FOR CONDITION A OF THE RESEARCH AND DEVELOPMENT SURVEY 5 INTIMATE PARTNER VIOLENCE FORMATTING EXPERIMENT BASED ON CONSTRUCTS, RESPONDENT GENDER, AND PERPETRATOR GENDER.

Survey Item	Construct Measured by Item	Female Respondent			Male Respondent		
		Unknown Perpetrator Gender	Male Perpetrator	Female Perpetrator	Unknown Perpetrator Gender	Male Perpetrator	Female Perpetrator
SV7	A/D vaginal sex with respondent	Rape	Rape	...	Made To Penetrate	...	Made To Penetrate
SV8	A/D perform anal sex penis in perpetrator's anus	Made To Penetrate	Made To Penetrate	Made To Penetrate
SV9	A/D penis in respondent's anus	Rape	Rape	...	Rape	Rape	...

SV10a	A/D oral on respondent's vagina or penis	Rape	Rape	Rape	Made To Penetrate	Made To Penetrate	Made To Penetrate
SV10b	A/D oral on respondent's anus	Rape	Rape	Rape	Rape	Rape	Rape
SV11a	A/D perform oral on perpetrator's vagina or anus	Made To Penetrate	Made To Penetrate	Made To Penetrate	Made To Penetrate	Made To Penetrate	Made To Penetrate
SV11b	A/D perform oral on perpetrator's penis	Rape	Rape	...	Rape	Rape	...
SV11c	A/D insertion of fingers or object in respondent's vagina or anus	Rape	Rape	Rape	Rape	Rape	Rape
SV12	Forced vaginal sex	Rape	Rape	...	Made To Penetrate	...	Made To Penetrate
SV13	Forced to perform anal sex	Made To Penetrate	Made To Penetrate	Made To Penetrate
SV14	Forced to receive anal sex	Rape	Rape	...	Rape	Rape	...
SV15a	Forced oral on respondent's vagina or penis	Rape	Rape	Rape	Made To Penetrate	Made To Penetrate	Made To Penetrate
SV15b	Forced oral on respondent's anus	Rape	Rape	Rape	Rape	Rape	Rape
SV16a	Forced to perform oral on perpetrator's vagina or anus	Made To Penetrate	Made To Penetrate	Made To Penetrate	Made To Penetrate	Made To Penetrate	Made To Penetrate

SV16b	Forced to perform oral on perpetrator's penis	Rape	Rape	...	Rape	Rape	...
SV17	Forced insertion of fingers or object in respondent's vagina or anus	Rape	Rape	Rape	Rape	Rape	Rape
SV18a	Forced to attempt to perform vaginal sex (males only)	Made To Penetrate	...	Made To Penetrate
SV18b	Forced attempted vaginal (female), oral, or anal sex	Rape	Rape	Rape	...	Rape	Made To Penetrate
<p>... category not applicable</p> <p>NOTES: Experimental Condition A was administered to one third of the sample and used interleaved formatting and rosters to collect intimate partner violence information, akin to the approach used in the 2012 National Intimate Partner and Sexual Violence Survey. "A/D" refers to alcohol- or drug-facilitated behaviors. The question text specifically asks about behaviors when the respondent was "drunk, high, drugged, or passed out and unable to consent." Respondent gender is based on the binary gender variable (male/female) from the AmeriSpeak panel data. Perpetrator gender ("Male", "Female", or "Unknown") was provided by the respondent for each perpetrator they noted across the questionnaire.</p> <p>SOURCE: National Center for Health Statistics, 2023</p>							

The coding of rape and MTP in experimental Conditions B and C is less complex. While the respondent's sex is still considered, the perpetrators' gender are not directly used." Only male respondents received the items that led to a designation of MTP (for example, questions E07 through E10b). The decision matrix for these two outcomes for Conditions B and C is displayed in Table C.

Table C: Outcome Decision Matrix for Rape and Made-to-Penetrate (MTP) Codes for Conditions B and C of the Research and Development Survey 5 Intimate Partner Violence Formatting Experiment Based on Constructs and Respondent Gender.

Survey Item	Construct Measured by Item	Female Respondent	Male Respondent
E01	A/D, put mouth on respondent's vagina or anus	Rape	...
E02	A/D, insertion of fingers or object in respondent's vagina or anus	Rape	...

E03	A/D, penis in respondent's vagina	Rape	...
E04	A/D, penis in respondent's anus	Rape	...
E05	A/D, their penis in respondent's mouth	Rape	...
E06	A/D, insertion of fingers or object in respondent's anus	...	Rape
E07	A/D, female perpetrator made respondent put their penis in perpetrator's vagina	...	Made to Penetrate
E08	A/D, female perpetrator put their mouth on respondent's penis	...	Made to Penetrate
E09	A/D, female perpetrator made respondent put their mouth on perpetrator's vagina	...	Made to Penetrate
E10a	A/D, male perpetrator put their mouth on respondent's penis	...	Made to Penetrate
E10b	A/D, male perpetrator made respondent put their penis in perpetrator's anus	...	Made to Penetrate
E11a	A/D, male perpetrator put their penis in respondent's mouth
E11b	A/D, male perpetrator put their penis in respondent's anus	...	Rape
E12	A/D, male perpetrator put their mouth on respondent's anus	...	Rape
E33	PF/T, perpetrator put their mouth on respondent's vagina or anus	Rape	...
E34	PF/T, perpetrator inserted their fingers or object in respondent's vagina or anus	Rape	...
E35	PF/T, perpetrator's penis in respondent's vagina	Rape	...
E36	PF/T, perpetrator's penis in respondent's anus	Rape	...
E37	PF/T, perpetrator's penis in respondent's mouth	Rape	...
E38	PF/T, perpetrator inserted their fingers or object in respondent's anus	...	Rape
E39	PF/T, female perpetrator made respondent put their penis in perpetrator's vagina	...	Made to Penetrate
E40	PF/T, female perpetrator put their mouth on respondent's penis	...	Made to Penetrate
E41	PF/T, female perpetrator made respondent put their mouth on perpetrator's vagina	...	Made to Penetrate
E42a	PF/T male perpetrator put their mouth on respondent's penis	...	Made to Penetrate
E42b	PF/T, male perpetrator made respondent put their penis in perpetrator's anus	...	Made to Penetrate
E43a	PF/T, male perpetrator put their penis in respondent's mouth	...	Rape
E43b	PF/T, male perpetrator put their penis in respondent's anus	...	Rape

E44	PF/T, male perpetrator put their mouth on respondent's anus	...	Rape
E65	ATT, try to put their mouth on respondent's vagina / anus	Rape	...
E66	ATT, male perpetrator try to put their mouth on respondent's vagina / anus	Rape	...
E67	ATT, try to put their mouth on respondent's penis	...	Made to Penetrate
E68	ATT, female perpetrator try to make respondent put their penis in perpetrator's vagina	...	Made to Penetrate
E69	ATT, female perpetrator try to make respondent put their mouth on perpetrator's vagina	...	Made to Penetrate
E70	ATT, male perpetrator try to put their penis in respondent's mouth or anus	...	Rape
E71	ATT, male perpetrator try to put their mouth on respondent's anus	...	Rape

... category not applicable

NOTES: Experimental Condition B was administered to one third of the sample and mainly used grouped formatting and rosters to collect intimate partner violence information, akin to the approach used in the 2016 National Intimate Partner and Sexual Violence Survey. Experimental Condition C was administered to one third of the sample and mainly used grouped formatting and rosters to collect intimate partner violence information, akin to the approach used in the 2016 National Intimate Partner and Sexual Violence Survey. Condition C differed from Condition B only in the ordering of the questionnaire sections, with the Physical Violence section administered before the other intimate partner violence sections. "A/D" refers to alcohol- or drug-facilitated behaviors. The question text specifically asks about behaviors when the respondent was "drunk, high, drugged, or passed out and unable to consent." "PF/T" indicates the perpetrator used physical force or threats of physical force. "ATT" indicates the perpetrator used physical force or threats of physical force to try and force the respondent to perform an action, but it did not happen. Respondent gender is based on the binary gender variable (male/female) from the AmeriSpeak panel data.

Sexual Coercion and Unwanted Sexual Contact

The constructs of sexual coercion and unwanted sexual contact are measured with three and two questions across all the experimental conditions, respectively. These survey items' text, the experimental condition they were administered in, and the corresponding constructs are shown in Table D.

Table D: Survey Items and Wording Used to Measure Sexual Coercion and Unwanted Sexual Contact in the Research and Development Survey 5 Intimate Partner Violence Formatting Experiment.

Survey Item	Construct Measured	Experimental Condition	Question Text
-------------	--------------------	------------------------	---------------

SV19	Sexual Coercion	A	How many people have you had vaginal, oral, or anal sex with after they pressured you by doing things like telling you lies, making promises about the future they knew were untrue, threatening to end your relationship, or threatening to spread rumors about you?
SV20	Sexual Coercion	A	How many people have you had vaginal, oral, or anal sex with after they pressured you by wearing you down by repeatedly asking for sex, or showing they were unhappy?
SV21	Sexual Coercion	A	How many people have you had vaginal, oral, or anal sex with after they pressured you by using their influence or authority over you, for example, your boss or your teacher?
D06	Sexual Coercion	B/C	How many people have you had vaginal, oral, or anal sex with after they pressured you by: Telling you lies, making promises about the future they knew were untrue, threatening to end your relationship, or threatening to spread rumors about you?
D07	Sexual Coercion	B/C	How many people have you had vaginal, oral, or anal sex with after they pressured you by: Wearing you down by repeatedly asking for sex, or showing they were unhappy?
D08	Sexual Coercion	B/C	How many people have you had vaginal, oral, or anal sex with after they pressured you by: Using their influence or authority over you, for example, your boss or your teacher?
SV5	Unwanted Sexual Contact	A	How many people have ever kissed you in a sexual way when you didn't want it to happen?
SV6	Unwanted Sexual Contact	A	How many people have ever fondled, groped, grabbed, or touched you in a way that made you feel unsafe?
D03	Unwanted Sexual Contact	B/C	How many people have ever kissed you in a sexual way when you did not want it to happen?
D04	Unwanted Sexual Contact	B/C	How many people have ever fondled, groped, grabbed, or touched you in a sexual way when you did not want it to happen?

NOTES: Experimental Condition A was administered to one third of the sample and used interleaved formatting and rosters to collect intimate partner violence information, akin to the approach used in the 2012 National Intimate Partner and Sexual Violence Survey. Experimental Condition B was administered to one third of the sample and mainly used grouped formatting and rosters to collect intimate partner violence information, akin to the approach used in the 2016 National Intimate Partner and Sexual Violence Survey. Experimental Condition C was administered to one third of the sample and mainly used grouped formatting and rosters to collect intimate partner violence information, akin to the approach used in the 2016 National Intimate Partner and Sexual Violence Survey. Condition C differed from Condition B only in the ordering of the questionnaire sections, with the Physical Violence section administered before the other intimate partner violence sections.

SOURCE: National Center for Health Statistics, 2023

Stalking

The measurement of stalking varies considerably across experimental Condition A and Conditions B and C. In the interleaved Condition A, a respondent is coded as having been stalked if they answer either 1) that at least one perpetrator has used a stalking tactic more than once, or 2) at least one perpetrator has used more than one of these tactics, and 3) that they felt either “very fearful” (question SFU1a) or believed that either they or someone they were close to would come to harm or be killed due to the stalking (question SFU4). On the other hand, for Conditions B and C (which used grouped formatting), respondents are asked a series of binary yes/no questions regarding whether they had ever experienced any of a series of stalking tactics (questions C01 through C09). They were then asked a follow-up question (question C10) about how many of the people who did any one of the stalking tactics did any of those things to them more than once. If their answer to this was greater or equal to one, they were asked another set of follow-up questions about whether these people made them fearful (question C11A) or had threatened them or others (question C11B). The respondent was coded as having been stalked if they answered one or more to either C11A or C11B. The questions used to measure stalking are shown in Table E.

Table E: Survey Items and Wording Used to Measure Stalking in the Research and Development Survey 5 Intimate Partner Violence Formatting Experiment.

Survey Item	Experimental Condition	Question Text
S1	A	How many people have made unwanted phone calls to you? This includes hang-up calls.
S2	A	How many people have ever sent you unwanted emails, instant messages, or sent messages through websites like Facebook?
S3	A	How many people have ever left you cards, letters, flowers, or presents when they knew you didn’t want them to?

S4	A	How many people have ever watched or followed you from a distance, or spied on you with a listening device, camera, or GPS (global positioning system)?
S5	A	How many people have ever approached you or showed up in places, such as your home, workplace, or school when you didn't want them to be there?
S6	A	How many people have ever left strange or potentially threatening items for you to find?
S7	A	How many people have ever sneaked into your home or car and did things to scare you by letting you know they had been there?
S8	A	How many people have ever left you unwanted messages? This includes text or voice messages.
SFU1	A	[CONDITIONAL ON S1 through S8] Were you ever fearful when [PERPETRATOR INITIALS] did [STALKING BEHAVIORS(S)]?
SFU1a	A	[CONDITIONAL ON SFU1] Thinking about when you were the most fearful, how fearful were you about the things [PERPRETRATOR] did? (Very fearful, Somewhat fearful, A little fearful)
SFU4	A	[CONDITIONAL ON SFU1] Did you ever believe you or someone close to you would be seriously harmed or killed when [PERPRETRATOR] did [STALKING TACTIC]?
C01	B/C	Has anyone ever followed you around and watched you when you did not want them to?
C02	B/C	Has anyone ever approached you or showed up in places, such as your home, work, or school when you did not want them to?
C03	B/C	Has anyone ever used GPS technology or equipment to monitor or track your location when you did not want them to? This includes GPS technology used in a phone or in social media, such as Facebook
C04	B/C	Has anyone ever left strange or potentially threatening items for you to find?
C05	B/C	Has anyone ever sneaked into your home or car and did things to scare you by letting you know they had been there?
C06	B/C	Has anyone ever used technology such as a hidden camera, recorder, or computer software to spy on you from a distance?
C07	B/C	Has anyone ever made unwanted phone calls to you, including hang-ups and voice messages?
C08	B/C	Has anyone ever sent you unwanted text messages, photo messages, emails, or messages through Facebook, Twitter, or other social media?
C09	B/C	Has anyone ever sent you cards, letters, flowers, or presents when they knew you didn't want them to?

C10	B/C	[CONDITIONAL ON C01 through C09] How many people did any of these things to you on more than one occasion?
C11A	B/C	[CONDITIONAL ON C10] Now, thinking about the [person/people] who followed, contacted, or harassed you on more than one occasion, how many of those people ever made you fearful or feel threatened, or concerned for your safety or the safety of others?
C11B	B/C	[CONDITIONAL ON C10] Now, thinking only about the [person/people] who followed, contacted, or harassed you on more than one occasion, how many of those people ever made threats to physically harm you? Please include all people who made threats to physically harm you even if you did not take the threat seriously or did not feel fearful, threatened, or concerned for your safety or the safety of others.

Physical Violence

Physical violence was measured across all three experimental conditions by explicitly asking about intimate partner physical violence, with the stem of each question starting with “How many of your current or ex romantic or sexual partners have ever...” as shown in Table F.

Table F: Survey Items and Wording Used to Measure Physical Violence in the Research and Development Survey 5 Intimate Partner Violence Formatting Experiment.

Survey Item	Experimental Condition	Question Text
PV2	A	How many of your current or ex romantic or sexual partners have ever slapped you?

PV3	A	How many of your current or ex romantic or sexual partners have ever pushed or shoved you?
PV4	A	How many of your current or ex romantic or sexual partners have ever hit you with a fist or something hard?
PV5	A	How many of your current or ex romantic or sexual partners have ever kicked you?
PV6	A	How many of your current or ex romantic or sexual partners have ever hurt you by pulling your hair?
PV7	A	How many of your current or ex romantic or sexual partners have ever slammed you against something?
PV9	A	How many of your current or ex romantic or sexual partners have ever tried to hurt you by choking or suffocating you?
PV10	A	How many of your current or ex romantic or sexual partners have ever beaten you?
PV11	A	How many of your current or ex romantic or sexual partners have ever burned you on purpose?
PV12	A	How many of your current or ex romantic or sexual partners have ever used a knife or gun on you?

Intimate Partner Violence

Respondents were further asked questions regarding their relationship with perpetrators across each of the victimization outcomes of interest. The approaches to collecting this information differed across the versions of the questionnaire.

In experimental Condition A, a rostering approach was used whereby for each perpetrator the respondent reported, they were then asked to provide that perpetrator’s initials (or some other identifying string), their gender, and their relationship to the respondent. Note that in RANDES 5, there was a limit of three perpetrators for each behavior, whereas in the 2012 NISVS itself, there was a limit of 15 for lifetime questions and 15 for questions about the previous 12 months. In the case of RANDES 5, if respondents initially answered that more than three people had perpetrated a behavior, they were asked to fill in the roster information for just the *first* three individuals who had ever done that behavior towards them. This relationship information for each roster member can then be used to determine whether the respondent has experienced “intimate partner violence” for each of the outcomes of interest, with an intimate partner being defined as someone the respondent reports that they were “...involved with romantically or sexually either at the time [of the behavior] or previously.”

In Conditions B and C, the full rostering approach was dropped in favor of a more streamlined approach wherein respondents were asked follow-up questions about the first three people who ever perpetrated a series of behaviors, instead of the first three people for *each* behavior. For instance, in the stalking section for

experimental conditions B and C, respondents were asked all of questions C01 through C11B (see Stalking section above) and were then asked to provide the gender and relationship of the first three people who ever used *any* of those tactics. Given this relationship information, intimate partner violence was coded as cases where the behaviors were perpetrated by someone the respondent “...was involved with romantically or sexually either at the time [of the behavior] or previously.”

Number of Perpetrators

The total number of reported perpetrators can be derived from respondents’ answers to the intimate partner violence items discussed previously. Given the substantial differences in how these data were collected in experimental Condition A (where a roster was used, with a cap of three new roster entries per behavior) versus experimental Conditions B and C (where an open-ended text box asking respondents “How many people have ever...” for groups of behavior), the data are not directly comparable across the conditions.

Survey and Data Quality Metrics

In addition to intimate partner violence related outcomes, a series of survey and data quality metrics are used to evaluate the performance of the three versions of the questionnaire.

Unit Completion

The RANDS unit completion rate is defined as the percent of respondents who complete the survey either by clicking “Finish Survey” on the last screen of the survey in the CAWI (Computer Assisted Web Interview) mode, or by reaching the end of the interview in the CATI (Computer Assisted Telephone Interview) mode out of all the respondents who begin the survey. Note that this is a different metric than the overall survey completion rate, which is the percent of all sampled panelists who finish the survey. These estimates are presented as unweighted percents.

Item Missingness

A common metric of both survey burden and data quality is item missingness, or the rate at which respondents fail or actively refuse to answer questionnaire items. When comparing survey questionnaires, a general assumption is that versions with lower item missing rates produce higher quality data than those with higher item missing rates. Given the structural differences in the length and complexity of the experimental conditions, the unweighted percent of items missing out of the total number of items the respondent received is presented here to normalize the data so that the item missing rates can be compared across the conditions.

Unit Response Latency

Unit response latency, or the amount of time it takes for a respondent to complete the full survey, is a proxy measure of objective response burden. Both NORC's CAWI and CATI survey software captured the date and time that respondents started and completed RANDS 5; unit latency was derived from these start and end times. These estimates are presented as unweighted means of minutes.

Subjective Burden

In addition to objective measures of response quality and burden such as item missingness and response latency, RANDS 5 included a set of questions designed to measure respondents' perceptions of burden, or "subjective burden." The two subjective burden items were the final two questions on RANDS 5 and asked respondents to consider their experience across the entire survey. The first question asked "How burdensome was it to complete this survey?" while the second asked "How difficult was it to answer the questions?" Both items used a labeled one to five scale for answer categories: "1. Not at all burdensome/difficult", "2. A little burdensome/difficult", "3. Moderately burdensome/difficult", "4. Very burdensome/difficult", "5. Extremely burdensome/difficult". These scores are presented individually as unweighted means.

Covariates

In addition to experimental condition and survey completion mode, the following independent variables were used in the analysis: sex, age, race and Hispanic origin, education, marital status, household income, self-rated health, self-rated mental health, whether or not the respondent had ever been diagnosed with hypertension, high cholesterol, coronary heart disease, chronic obstructive pulmonary disease (COPD), cancer, diabetes, or irritable bowel syndrome (IBS), and whether or not the respondent was currently experiencing frequent headaches, asthma, chronic pain, or difficulty sleeping. Sex was collected by NORC with a question asking, "Are you male or female," which is the same wording as on the NHIS. NORC uses the term "gender" to label the variable and recent question evaluation research on this and similar questions has revealed that respondents primarily interpret this item as one about gender identity instead of biological sex [16] [17]. The term "sex" is used in this paper and the accompanying tables to be consistent with current NCHS style guidelines and variable labeling in the NHIS. Age (in years) is categorized as 18-24, 25-44, 45-64, and 65 and over. Race and Hispanic origin is categorized as Black non-Hispanic, White non-Hispanic, Other race non-Hispanic, and Hispanic. "Other Race Non-Hispanic" includes panelists who indicated their race(s) were non-Hispanic Asian, some other non-Hispanic race, or a combination of two or more non-Hispanic races, and are

combined for analytic purposes given the small sample sizes of these groups in the AmeriSpeak Panel and the RANDS 5 sample. Education is categorized as less than high school graduate, high school graduate or GED holder, some college (including Associates degree), Bachelor’s degree, and post-graduate degree. Marital status is categorized as divorced, married or living with a partner, never married, separated, and widowed. Household income is categorized as less than \$25,000, \$25,000 to less than \$50,000, \$50,000 to less than \$75,000, and \$75,000 or greater. Both self-rated health and self-rated mental health are categorized as excellent, very good, good, fair, or poor.

Statistical Analysis

Unless otherwise noted, findings presented in this report are weighted and were evaluated based on the NCHS Data Presentation Standards for Proportions [18]. Weights were constructed so that each individual experimental condition is weighted to the national civilian, non-institutionalized, adult population, and then calibrated to the 2020 NHIS [19]. Unknown and missing values are excluded from denominators when calculating percents and means. Analysis was conducted using R version 4.3 [20] and the “survey” package, which allows estimates to be calculated that take RANDS 5’s complex survey design into account [21] [22]. All results, whether weighted or unweighted, use the complex survey design for variance estimation.

The prevalence of binary and categorical outcome variables and survey and data quality metrics described above were compared across experimental conditions (both overall and pairwise) and survey completion mode using chi square tests with Rao and Scott’s second-order correction [23]. One-way analysis of variance (ANOVA) F-tests and one-sided pairwise t-tests were used to compare continuous variables across the three experimental conditions. Ninety-five percent confidence intervals are presented for continuous measures. P-values were not adjusted for multiple comparisons, and an alpha of 0.05 is used throughout.

Findings

Sample Characteristics

Assignment to the experimental conditions occurred at the point of sampling from the AmeriSpeak Panel, using a random number generator implemented into the survey programming. Given this, the final unweighted distribution of the conditions across the complete cases differ slightly—with 33.6% (SE = 0.5%), 33.1% (SE = 0.5%), and 33.3% (SE = 0.5%) across Conditions A, B, and C, respectively. A Pearson’s chi-square test indicates that this distribution of the cases across the experimental conditions did not differ significantly ($\chi^2_{(2)} = 0.5$, p-value = 0.8). Furthermore, a series of second order Rao-Scott chi square tests show no significant

differences in the distribution of sex, race and Hispanic origin, education, age, marital status or household income. Given these findings, the analysis of the RANDS 5 data presented in this report will proceed under the assumption of random assignment to the three experimental conditions.

Table G presents the unweighted sample sizes and weighted percent distributions across select demographic characteristics overall and across the three experimental conditions, as well as the results of chi square tests comparing the percent distributions across the three experimental conditions.

Table G: Unweighted sample sizes and weighted percents (with standard errors) of adults age 18 and older for selected demographic characteristics, overall and by Research and Development Survey 5 intimate partner violence formatting experimental condition.

Experimental Condition A was administered to one third of the sample and used interleaved formatting and rosters to collect intimate partner violence information, akin to the approach used in the 2012 National Intimate Partner and Sexual Violence Survey. Experimental Condition B was administered to one third of the sample and mainly used grouped formatting and rosters to collect intimate partner violence information, akin to the approach used in the 2016 National Intimate Partner and Sexual Violence Survey. Experimental Condition C was administered to one third of the sample and mainly used grouped formatting and rosters to collect intimate partner violence information, akin to the approach used in the 2016 National Intimate Partner and Sexual Violence Survey. Condition C differed from

Condition B only in the ordering of the questionnaire sections, with the Physical Violence section administered before the other intimate partner violence sections. "n" refers to the sample size. "SE" refers to Standard Error. "COPD" refers to chronic obstructive pulmonary disease. "IBS" refers to irritable bowel syndrome.

SOURCE: National Center for Health Statistics, Research and Development Survey 5, 2020

As shown in Table H, significant differences across the experimental conditions emerged for the self-rated mental health variable, but not for self-rated overall health. Pairwise comparisons across the three experimental conditions for self-rated mental health indicate that only Conditions A and B were statistically significantly different from one another. As shown in Table I, statistically significant differences across the experimental conditions emerged for hypertension, high cholesterol, frequent headaches, chronic pain, and difficulty sleeping. Pairwise comparisons of the questionnaires for each of these five variables show that in all five cases there were statistically significant differences between the Condition A and B questionnaires, as well as statistically significant differences between the Condition A and Condition C questionnaires for high cholesterol, chronic pain, and sleeping difficulties. None of these pairwise comparisons showed any significant differences between Conditions B and C.

As a reminder, the question wordings for these health variables did not vary across the three experimental conditions, though there was variation in their placement in the questionnaire: in Condition A's questionnaire the health conditions followed a set of questions regarding gender and sexual identity, whereas for Conditions B and C they were the first section of the questionnaire.

Victimization Outcomes of Interest and Results by Sex

In NISVS, victimization is measured for a variety of constructs including contact sexual violence (or CSV, which includes rape, made-to-penetrate or MTP, sexual coercion, and unwanted sexual contact), stalking, and

physical violence. Intimate partner violence is defined as when a person is victimized by a current or former romantic partner. For RANDS 5, these constructs were captured as described and used the coding schemes described in the Methodology section above. For each of these three constructs, tables are presented in Appendix A below providing 1) the overall prevalence and prevalence across each of the three experimental conditions, and 2) the prevalence for each construct by respondent sex (male and female, based on the binary data collected by NORC when forming the AmeriSpeak panel) separately.

Contact Sexual Violence (CSV)

Statistically significant differences were found across the three questionnaire versions for the aggregate measure of CSV (Table I, Appendix A). For the components of CSV, statistically significant differences were observed across the three questionnaires for the prevalence of rape, sexual coercion, and unwanted sexual contact. Comparison of MTP across the experimental conditions is not possible given the divergent approach to measuring this construct in the 2012 questionnaire-based condition (Condition A, where being made to penetrate could be identified for both male and female respondents), and the 2016 questionnaire-based conditions (Conditions B and C, where the MTP measure applies only to male respondents). Pairwise comparisons show that in most cases, all three versions of the RANDS 5 questionnaire produced statistically significantly different results than the other two.

For men (Table II, Appendix A), there were statistically significant differences found across the three questionnaire versions for the aggregate CSV measure, as well as for MTP, and unwanted sexual contact individually. Pairwise comparisons showed significant differences between both Conditions B and C and Condition A for MTP, unwanted sexual contact and for aggregate CSV. For women (Table III, Appendix A), there were statistically significant differences found across the questionnaires for all the components of CSV and aggregate CSV, with pairwise analysis finding significant differences between Condition B and the other two conditions.

The estimates for intimate partner unwanted sexual contact and sexual coercion were statistically significantly different across the experimental conditions with the pairwise comparisons showing that Condition A differed from both Condition B and C in both cases (Table IV, Appendix A). For intimate partner CSV for men, rape, unwanted sexual contact, sexual coercion, and aggregate CSV showed statistically significant differences; across all of these constructs pairwise comparisons showed that experimental Condition A differed significantly from experimental Conditions B and C, which did not differ from one another (Table V, Appendix A). For intimate partner CSV for women, while rape, unwanted sexual contact, and sexual coercion showed

statistically significant differences across the experimental conditions, aggregate CSV did not (Table VI, Appendix A). Pairwise comparisons showed that Condition A and C differences were statistically significant for intimate partner rape, Condition A differed significantly from Conditions B and C for intimate partner unwanted sexual contact, and all three conditions differed significantly from one another for intimate partner sexual coercion.

Stalking

Statistically significant differences were found in the prevalence of both overall stalking and intimate partner stalking (Table VII, Appendix A), with one-sided pairwise analyses showing that in both constructs experimental Condition A led to a statistically significantly lower estimate than did experimental Conditions B or C. The same patterns hold up when considering the prevalence of overall stalking and intimate partner stalking for the male (Table VIII, Appendix A) and female (Table IX, Appendix A) populations separately, with one-sided pairwise analyses showing that Condition A produces statistically significantly lower estimates than either Conditions B or C (which were not statistically different from one another).

Physical Violence

Across all three experimental conditions, a total intimate partner physical violence prevalence of 38.8% (95% CI: (36.9, 40.8), not shown) was found with no statistically significant differences emerging across the three experimental conditions (Table X, Appendix A). Likewise, no statistically significant differences emerged across the estimates for intimate partner physical violence for men (Table XI, Appendix A), though it did for women (Table XII, Appendix A). The pairwise analysis for women shows that the estimate derived from Condition A was statistically significantly different from those derived from Conditions B and C, neither of which were significantly different from one another.

As noted previously, the intent of the physical violence questions across all three experimental conditions was to specifically measure intimate partner physical violence (as shown in Table F, all physical violence questions were framed with the text “How many of your current or ex romantic or sexual partners have ever...”). However, just as with the other sections in experimental Condition A, the respondents’ relationships with the perpetrators indicated in this section were collected in a later rostering section. As such it was possible to see whether respondents assigned to this condition understood this prompt limiting their answer to intimate partners. Fourteen percent (95% CI: (12.0, 16.3), unweighted, not shown) of respondents who reported a Physical Violence behavior in this section later indicated that the behavior was not perpetrated by an intimate partner. This amount of conceptual mismatch provides some indication that the mental frame that respondents used when answering this series of items was wider than simply “current or ex romantic partners” (i.e., “intimate partners”).

Total Intimate Partner Violence

A respondent can be described as having a history of intimate partner violence (IPV) if they indicated any instance of intimate partner CSV, stalking, or physical violence. Across all three experimental conditions, the overall prevalence of IPV was 46.0% (95% CI: (44.2, 47.8), not shown) and no statistically significant differences were found across the three experimental conditions (Table XIII, Appendix A). The differences across the experimental conditions in IPV prevalence for men (Table XIV, Appendix A) were not statistically significant, though they were for women (Table XV, Appendix A). The pairwise analysis for women reveals that only Conditions A and B produced significantly different estimates of total IPV from one another, while Conditions A versus C and Conditions B versus C did not.

Results by Mode

As noted above, RANDS 5 was conducted across two survey administration modes, via either self-response using a web platform or interviewer-administered over the phone, depending on the panelists' preferences. A comparison of the unweighted counts of complete responses across these two administration modes by the three experimental conditions shows that the mode distribution across the conditions was not significantly different (Table XVI, Appendix A). For the comparison of the IPV components by mode discussed below, small sample sizes limit the tables and analysis to just the three main areas (CSV, stalking, and physical violence), and not their constituent subcomponents.

Contact Sexual Violence

The differences in the prevalence of aggregate contact sexual violence (Table XVII, Appendix A) across the experimental conditions by survey mode were not statistically significant overall. For intimate partner overall contact sexual violence no statistically significant differences emerged (Table XVIII, Appendix A).

Stalking

No statistically significant differences emerged across the experimental conditions by survey mode for either overall stalking (Table XIX, Appendix A) or intimate partner stalking (Table XX, Appendix A).

Physical Violence

No statistically significant differences across the experimental conditions by survey mode were found overall (Table XXI, Appendix A).

Total Intimate Partner Violence

For total intimate partner violence (Table XXII, Appendix A), a statistically significant difference was found across the experimental conditions between modes, though none were found within the three individual conditions (possibly due to the large standard errors for the telephone mode for the three conditions).

Number of Perpetrators

One final substantive metric to consider across the experimental conditions is the total number of perpetrators respondents reported across the entire questionnaire. As noted in the Methodology section, given the differences in how the data was collected for Condition A and Conditions B and C, these data (Table J) are not directly comparable but can provide a sense of how much data each approach collects.

Table J: Weighted means, medians, and other selected percentiles (25th, 75th, maximum), and standard deviations of the number of perpetrators by Research and Development Survey 5 intimate partner violence formatting experimental condition.

Questionnaire	Mean	Q25	Median	Q75	Maximum	SD
Condition A	5.5	0	2	7	70	8.2
Condition B	7.2	0	3	9	457	15.3
Condition C	8.0	0	2	7	1,734	46.7

NOTES: Total complete cases, n=6,896. Experimental Condition A was administered to one third of the sample and used interleaved formatting and rosters to collect intimate partner violence information, akin to the approach used in the 2012 National Intimate Partner and Sexual Violence Survey. Experimental Condition B was administered to one third of the sample and mainly used grouped formatting and rosters to collect intimate partner violence information, akin to the approach used in the 2016 National Intimate Partner and Sexual Violence Survey. Experimental Condition C was administered to one third of the sample and mainly used grouped formatting and rosters to collect intimate partner violence information, akin to the approach used in the 2016 National Intimate Partner and Sexual Violence Survey. Condition C differed from Condition B only in the ordering of the questionnaire sections, with the Physical Violence section administered before the other intimate partner violence sections. "Q25" refers to the 25th percentile. "Q75" refers to the 75th percentile. "SD" refers to the standard deviation.

SOURCE: National Center for Health Statistics, Research and Development Survey 5, 2020

The extreme values vary across the conditions, with Condition A showing a maximum of 70 perpetrators, whereas Conditions B and C show 457 and 1,734 respectively.

Survey and Data Quality Metrics

A series of data quality metrics, presented here, can be used to better contextualize the substantive findings from RANDES 5. These measures of quality include completion and item missing rates, response latency, and subjective measures of response burden. The results in this section are unweighted.

Unit Completion

The differences in unit completion rates across the experimental conditions were statistically significant (Table K), with pairwise examinations showing that Condition A led to a greater amount of completion than either Condition B or C. However, the differences between the completion rates for Conditions B and C were not statistically significant.

Table K: Unweighted unit completion rates (with standard errors) of adults age 18 and older, overall and by Research and Development Survey 5 intimate partner violence formatting experimental condition.

Questionnaire	Percent (SE)	p-value ¹
Overall	92.2 (0.3)	
Condition A ‡ §	94.0 (0.5)	Less than 0.001
Condition B †	90.9 (0.6)	
Condition C †	91.7 (0.6)	

Pairwise comparisons across the three conditions are noted in the following way: † significant compared to Condition A; ‡ significant compared to Condition B; § significant compared to Condition C.

¹ p-value based on a chi-squared test of independence between the unit completion rate and the experimental condition type.

NOTES: Total complete cases, n=6,896. Experimental Condition A was administered to one third of the sample and used interleaved formatting and rosters to collect intimate partner violence information, akin to the approach used in the 2012 National Intimate Partner and Sexual Violence Survey. Experimental Condition B was administered to one third of the sample and mainly used grouped formatting and rosters to collect intimate partner violence information, akin to the approach used in the 2016 National Intimate Partner and Sexual Violence Survey. Experimental Condition C was administered to one third of the sample and mainly used grouped formatting and rosters to collect intimate partner violence information, akin to the approach

used in the 2016 National Intimate Partner and Sexual Violence Survey. Condition C differed from Condition B only in the ordering of the questionnaire sections, with the Physical Violence section administered before the other intimate partner violence sections. "SE" refers to Standard Error.
SOURCE: National Center for Health Statistics, Research and Development Survey 5, 2020

Item Missing Rates

The results of the one-way ANOVA exploring whether differences exist across the mean item missing percent by experimental condition (Table L) show a statistically significant difference across the three conditions' average item missingness. The experimental Condition A questionnaire had a significantly lower mean individual item missing rate than either the Condition B or the Condition C questionnaires. The difference between the Condition B and Condition C questionnaires was not statistically significant.

Table L: Unweighted mean item missing rates (with standard errors) of adults age 18 and older, overall and by Research and Development Survey 5 intimate partner violence formatting experimental condition.

Questionnaire	Mean (SE)	p-value ¹
Overall	19.4 (0.2)	
Condition A ‡ §	8.8 (0.3)	Less than 0.001
Condition B †	25.0 (0.3)	
Condition C †	24.5 (0.3)	

Pairwise comparisons across the three conditions are noted in the following way: † significant compared to Condition A; ‡ significant compared to Condition B; § significant compared to Condition C. ¹ p-value based on an F-test from a one-way ANOVA model.

NOTES: Total complete cases, n=6,896. Experimental Condition A was administered to one third of the sample and used interleaved formatting and rosters to collect intimate partner violence information, akin to the approach used in the 2012 National Intimate Partner and Sexual Violence Survey. Experimental Condition B was administered to one third of the sample and mainly used grouped formatting and rosters to collect intimate partner violence information, akin to the approach used in the 2016 National Intimate Partner and Sexual Violence Survey. Experimental Condition C was administered to one third of the sample and mainly used grouped formatting and rosters to collect intimate partner violence information, akin to the approach used in the 2016 National Intimate Partner and Sexual Violence Survey. Condition C differed from Condition B only in the ordering of the questionnaire sections, with the Physical Violence section administered before the other intimate partner violence sections. "SE" refers to Standard Error.

SOURCE: National Center for Health Statistics, Research and Development Survey 5, 2020

Response Latency

Unit response latency differed across the experimental conditions (Table M). The mean duration of the Condition A questionnaire was statistically significantly longer than either that of the Condition B or Condition C questionnaires; however, the difference in the response latency of Conditions B and C was not statistically significant.

Table M: Unweighted means of unit response latency in minutes (with standard errors) of adults age 18 and older, overall and by Research and Development Survey 5 intimate partner violence formatting experimental condition.

Questionnaire	Mean Time in Minutes (SE)	p-value ¹
Overall	13.2 (0.1)	Less than 0.001
Condition A ‡ §	15.7 (0.2)	
Condition B †	12.0 (0.2)	
Condition C †	12.0 (0.2)	

Pairwise comparisons across the three conditions are noted in the following way: † significant compared to Condition A; ‡ significant compared to Condition B; § significant compared to Condition C. ¹ p-value based on an F-test from a one-way ANOVA model.

NOTES: Total complete cases, n=6,896. Experimental Condition A was administered to one third of the sample and used interleaved formatting and rosters to collect intimate partner violence information, akin to the approach used in the 2012 National Intimate Partner and Sexual Violence Survey. Experimental Condition B was administered to one third of the sample and mainly used grouped formatting and rosters to collect intimate partner violence information, akin to the approach used in the 2016 National Intimate Partner and Sexual Violence Survey. Experimental Condition C was administered to one third of the sample and mainly used grouped formatting and rosters to collect intimate partner violence information, akin to the approach used in the 2016 National Intimate Partner and Sexual Violence Survey. Condition C differed from Condition B only in the ordering of the questionnaire sections, with the Physical Violence section administered before the other intimate partner violence sections. "SE" refers to Standard Error.

SOURCE: National Center for Health Statistics, Research and Development Survey 5, 2020

Subjective Burden and Difficulty

The unweighted mean subjective burden score differences were statistically significant across the three experimental conditions (Table N), though the unweighted mean subjective difficulty score differences (Table O) were not. Pairwise analysis of the subjective burden scores indicates that the questionnaire for Condition A had significantly higher subjective burden than that for Condition B, whereas the differences between the subjective burden for Conditions A and C and Conditions B and C were not statistically significant.

Table N: Unweighted mean subjective burden scores (with standard errors) of adults age 18 and older, overall and by Research and Development Survey 5 intimate partner violence formatting experimental condition.

Questionnaire	Mean Burden Score (SE)	p-value ¹
Overall	1.8 (0.0)	Less than 0.05
Condition A ‡	1.8 (0.0)	
Condition B †	1.7 (0.0)	
Condition C	1.7 (0.0)	

Pairwise comparisons across the three conditions are noted in the following way: † significant compared to Condition A; ‡ significant compared to Condition B; § significant compared to Condition C. ¹ p-value based on an F-test from a one-way ANOVA model.

NOTES: Total complete cases, n=6,896. Burden scores are taken from respondents' responses to the subjective burden question asked at the end of the survey ("How burdensome was it to complete this survey"), which used a 1 to 5 answer scale, where 1 = "Not at all burdensome" and 5 = "Extremely burdensome." Experimental Condition A was administered to one third of the sample and used interleaved formatting and rosters to collect intimate partner violence information, akin to the approach used in the 2012 National Intimate Partner and Sexual Violence Survey. Experimental Condition B was administered to one third of the sample and mainly used grouped formatting and rosters to collect intimate partner violence information, akin to the approach used in the 2016 National Intimate Partner and Sexual Violence Survey. Experimental Condition C was administered to one third of the sample and mainly used grouped formatting and rosters to collect intimate partner violence information, akin to the approach used in the 2016 National Intimate Partner and Sexual Violence Survey. Condition C differed from Condition B only in the ordering of the questionnaire sections, with the Physical Violence section administered before the other intimate partner violence sections. "SE" refers to Standard Error. "0.0" indicates a quantity more than zero but less than 0.05.

SOURCE: National Center for Health Statistics, Research and Development Survey 5, 2020

Table O: Unweighted mean subjective difficulty scores (with standard errors) of adults age 18 and older, overall and by Research and Development Survey 5 intimate partner violence formatting experimental condition.

Questionnaire	Mean Difficulty Score (SE)	p-value ¹
Overall	1.70 (0.0)	0.21
Condition A	1.73 (0.0)	
Condition B	1.69 (0.0)	
Condition C	1.69 (0.0)	

Pairwise comparisons across the three conditions are noted in the following way: † significant compared to Condition A; ‡ significant compared to Condition B; § significant compared to Condition C. ¹ p-value based on an F-test from a one-way ANOVA model.

NOTES: Total complete cases, n=6,896. Difficulty scores are taken from respondents' responses to the subjective difficulty question asked at the end of the survey ("How difficult was it to complete this survey"), which used a 1 to 5 answer scale, where 1 = "Not at all difficult" and 5 = "Extremely difficult." Experimental Condition A was administered to one third of the sample and used interleaved formatting and rosters to collect intimate partner violence information, akin to the approach used in the 2012 National Intimate Partner and Sexual Violence Survey. Experimental Condition B was administered to one third of the sample and mainly used grouped formatting and rosters to collect intimate partner violence information, akin to the approach used in the 2016 National Intimate Partner and Sexual Violence Survey. Experimental Condition C was administered to one third of the sample and mainly used grouped formatting and rosters to collect intimate partner violence information, akin to the approach used in the 2016 National Intimate Partner and Sexual Violence Survey. Condition C differed

from Condition B only in the ordering of the questionnaire sections, with the Physical Violence section administered before the other intimate partner violence sections. "SE" refers to Standard Error. "0.0" indicates a quantity more than zero but less than 0.05.

Discussion

To begin, it is important to note the limitations of data from the RANDES system. As discussed in the Methodology section, RANDES 5 (like all rounds of RANDES) was collected from a statistically-sampled survey panel—in this case NORC’s AmeriSpeak panel. While these data are useful for methodological evaluations such as those presented in this report, they are not of the same quality as data from traditional household surveys including the NHIS and NISVS.

The RANDES 5 intimate partner violence formatting experiment explored whether differences exist when collecting intimate partner violence constructs 1) using an interleaved rostering approach (akin to the format used in the 2012 NISVS) or using a simplified grouped approach (akin to the format used in the 2016 NISVS) and 2) when a survey questionnaire begins with sensitive questions or not. Respondents were randomly assigned into three experimental conditions that differed in both how, and the order in which, the IPV-related questions were administered:

Condition A: An interleaved and rostered data collection approach, with the physical violence IPV items presented before the stalking and sexual violence items.

Condition B: A grouped data collection approach with the stalking IPV items presented before the sexual violence and physical violence items.

Condition C: A grouped data collection approach with the physical violence IPV items presented before the stalking and sexual violence items.

This three-way experimental split is designed to allow examination of overall questionnaire formatting (the interleaved, rostered Condition A versus the grouped, simplified Conditions B and C), and order effects within the latter format (Condition B that starts with stalking and sexual violence versus Condition C that starts instead with physical violence).

The overall goal of this report is to present information that survey designers can use when considering approaches to collecting intimate partner violence data. While the substantive analysis of most of the tables

presented is best left to subject matter experts, there are a few methodology-related trends that should be highlighted.

First, in most cases, the point estimates of the various intimate partner violence constructs produced by the 2012 questionnaire were lower than those produced by the two 2016 questionnaires. In many cases these differences were statistically significant and pairwise testing showed that Condition A often produced statistically significantly lower estimates than either Conditions B or C, which in most cases were not significantly different from one another. This trend occurred across both sexes and modes as well, providing more evidence that the cause of these differences may be structural to the questionnaires, and not simply based on context effects related to the respondents' individual characteristics.

Second, some systematic measurement error was suggested when examining the maximum number of perpetrators shown in Table J. The extreme values seen in experimental Conditions B and C as compared to the maximum seen in experimental Condition A (for instance an extreme value for Condition C is a report of 1,734 total perpetrators) possibly represents some form of measurement error—either data entry error or deliberate reporting error by the respondent. This potential for differential measurement error between the Condition A and the Conditions B and C questionnaires most likely stems from the formatting and context of the various items used to collect perpetrator data. In experimental Condition A, respondents were asked “how many of your current or ex romantic or sexual partners have ever” done some action, and then immediately were asked to roster the first three of those perpetrators. On the other hand, in experimental Conditions B and C, the respondents were asked “How many of your current or ex-romantic or sexual partners have ever...” done some action about a series of related behaviors all at once and were then asked a limited number of follow-ups about the first three perpetrators who had done one or more of those actions.

Third, when considering various data quality and burden metrics (including unit and item non-response, response latency, and subjective burden scales), experimental Condition A appeared to produce higher data quality but led to more respondent burden as compared to experimental Conditions B and C. In this case data quality is defined as having lower levels of both unit and item non-response whereas response latency and subjective burden are used to measure respondent burden. On one hand, it follows that a questionnaire structured like Condition A (with the added requirement of filling out a roster of perpetrators) would both objectively take longer and feel more burdensome than a version without that requirement. However, the fact that (using the data quality metrics available) it also produces higher quality data does not seem to follow this increased burden—higher burden is typically associated with greater amounts of item non-response and drop-offs [24].

The differences between inter-leafed and grouped questionnaire formatting potentially tie together both the substantive analysis of the intimate partner violence constructs and the data quality/burden trends. As noted above, inter-leafed questions ask a filter question and then a set of immediate follow-ups (in this case, the rostering is the immediate follow-up), while in grouped format a “group” of filter questions are administered before a series of follow-ups. Previous research has shown, for instance, that an inter-leafed format can produce smaller estimates as compared to grouped formats when respondents begin to learn the format as they go through the questionnaire—in short, they attempt to reduce their burden by under-reporting and thus skipping out of questions [7] [9]. However, there is also some qualitative evidence that the grouped format has decreased response quality as compared to the inter-leafed format [25]. Without a “gold standard” to which we can compare these results, however, the differential response quality of the experimental conditions’ perpetrator data is difficult to determine.

Practically speaking, survey designers and programs need to consider the trade-offs of using a more burdensome format versus one that is less burdensome but produces higher levels of item non-response. The data from RANDS 5 does show that formatting matters, but further analysis by subject matter experts may be beneficial to determine which of the two experimental formats is more appropriate for the collection of intimate partner violence data.

Appendix A: Supplementary Data Tables

Table 1: Weighted percents (with standard errors) of adults age 18 and older reporting aggregate contact sexual violence, rape, sexual coercion, and unwanted sexual contact, overall and by Research and Development Survey 5 intimate partner violence formatting experimental condition.

Outcome	Questionnaire	Percent (SE)	p-value ¹
Aggregate Contact Sexual Violence ²	Overall	45.3 (1.0)	Less than 0.001
	Condition A ‡ §	39.8 (1.5)	
	Condition B † §	51.3 (2.0)	
	Condition C † ‡	44.9 (1.4)	
Rape	Overall	18.2 (0.7)	Less than 0.01
	Condition A ‡ §	15.8 (1.1)	
	Condition B † §	21.7 (1.7)	
	Condition C † ‡	17.2 (0.9)	
Sexual Coercion	Overall	22.5 (0.8)	Less than 0.01
	Condition A ‡	19.1 (1.6)	
	Condition B † §	26.4 (1.6)	
	Condition C ‡	22.1 (1.1)	
Unwanted Sexual Contact	Overall	37.9 (1.0)	Less than 0.001
	Condition A ‡ §	32.2 (1.6)	
	Condition B † §	43.7 (2.0)	
	Condition C † ‡	38.0 (1.4)	

Pairwise comparisons across the three conditions are noted in the following way: † significant compared to Condition A; ‡ significant compared to Condition B; § significant compared to Condition C.

¹ p-values based on a chi-squared test of independence between each outcome and the experimental condition type.

² Aggregate Contact Sexual Violence includes rape, sexual coercion, unwanted sexual contact, and being made to penetrate (for male respondents only).

NOTES: Total complete cases, n=6,896. Experimental Condition A was administered to one third of the sample and used interleaved formatting and rosters to collect intimate partner violence information, akin to the approach used in the 2012 National Intimate Partner and Sexual Violence Survey. Experimental Condition B was administered to one third of the sample and mainly used grouped formatting and rosters to collect intimate partner violence information, akin to the approach used in the 2016 National Intimate Partner and Sexual Violence Survey. Experimental Condition C was administered to one third of the sample and mainly used grouped formatting and rosters to collect intimate partner violence information, akin to the approach used in the 2016 National Intimate Partner and Sexual Violence Survey. Condition C differed from Condition B only in the ordering of the questionnaire sections, with the Physical Violence section administered before the other intimate partner violence sections. "SE" refers to Standard Error. Made to Penetrate prevalence not displayed because only male respondents received questions about this concept.

Appendix B: RANDS Sampling, Data Processing, and Weighting

RANDS 5 was administered to a sample of NORC's AmeriSpeak adult (age 18 and older) survey panel using both web (self-report) and telephone interviews. AmeriSpeak is a probability-based, recruited panel of potential survey respondents developed and maintained by NORC. NORC maintains a set of demographic and household information about each panelist, which can be included alongside the variables collected on a survey in a final data file. AmeriSpeak is primarily a web-based panel, in that most of its respondents choose to participate in surveys via a self-response interface via the internet (either on computers or mobile devices), however some panelists choose to participate in surveys via Computer Assisted Telephone Interviews (CATI) instead. More information about the panel can be found on NORC's AmeriSpeak website (<https://amerispeak.norc.org>).

As has been done for previous rounds of RANDS, a stratified sample was taken from the AmeriSpeak Panel for RANDS 5. Sampling strata were based on age, race and ethnicity, educational attainment, sex, and household income for a total of 96 strata. The sample size for each stratum was based on population distributions and NORC's experience with the AmeriSpeak Panel including differential completion rates by demographic groups. While multiple members of a household may be included in the panel, only one adult household member was sampled for RANDS 5. Additionally, the sample only included panel members who had not been sampled into another survey within the same week as the RANDS sample was drawn. Sampled members were invited via email or phone, and a series of follow-up email reminders and calls were used to gain cooperation. Panelists sampled into RANDS 5 were offered an incentive equivalent to \$5 for web respondents and \$10 for phone respondents.

Following data collection, NORC processed the data by removing responses that triggered data-quality checks, including speeding (those that completed the survey in less than 1/3 of the median duration) and extremely high item non-response (those that skipped or refused more than 50% of the questions for which they were eligible to receive). These cases were not assigned "complete" disposition codes and were not included for weighting; however, these cases were included in the final data file with a disposition code of "invalid." In total, NORC judged 316 (out of 7,480 respondents who started the survey) to be invalid. An evaluation of the unweighted distribution of these cases across a set of demographic variables indicates that the behaviors that lead to a response being assigned an ineligible disposition are not randomly distributed. A series of Pearson chi-square tests (results not shown in tables) show that the invalid disposition differs significantly across sex (p-value <0.001), age (p-value <0.001), race (p-value <0.001), and educational attainment (p-value <0.001) groups. Respondents who are younger, female, Hispanic or non-Hispanic Black, and with high school diplomas or less are more likely to have their responses removed from the final weighted dataset and this should be considered when analyzing the data presented in this report.

NORC provided sample weights for RANDS 5 which account for the sample design and are calibrated to U.S. population counts to account for differential nonresponse and under coverage of some groups on the sample frame. The sample weights developed by NORC were based on the panel weights from the AmeriSpeak Panel and the survey-specific sampling weights for RANDS 5 itself. The panel weights account for the sampling

probability from the AmeriSpeak Panel, calculated as the inverse probability of selection from the NORC National Sample Frame, and are adjusted for nonresponse and for a subsample of housing units that have a nonresponse follow-up. These panel weights are adjusted using raking to align the panel weights with external population totals obtained from the March 2021 U.S. Census Bureau's Current Population Survey (CPS). From the panel weights, the RANDS survey-specific sampling weights are derived using the probability of selection into RANDS associated with a sampled panel member and an adjustment for nonresponse to the RANDS survey. These weights are then raked to adult population totals, trimmed for extreme weights (with a criterion of minimizing the mean square error associated with key survey estimates), and raked again to the same population totals to form the final NORC-provided sample weights. Following these procedures, NORC calculates a survey design effect, which for RANDS 5 was 1.95.

Beyond the survey-specific sampling weights calculated by NORC, NORC-provided sample weights for RANDS 5 were adjusted through an additional post-stratification step in which the marginal totals of RANDS 5 were raked to the marginal population totals from the National Health Interview Survey (NHIS). This step is designed to bring the RANDS data in line with NCHS' gold standard household health survey, and is conducted for each round of RANDS. Specifically, for RANDS 5, the NORC-provided weights were raked using the 2020 NHIS sample adult file (n = 31,997) on the following demographic and health characteristics: age, sex, race and Hispanic origin, education, household/family income, Census region, marital status, ever diagnosed high cholesterol, ever diagnosed asthma, ever diagnosed hypertension, ever diagnosed diabetes, metropolitan status, and phone service. Characteristics with missing values in both RANDS and the NHIS were included in the raking procedure, while characteristics with missing values in one of the surveys were removed for the raking step with an adjustment to the weights for the non-missing values. The calibrated weights were proportionally adjusted to the total number of respondents in RANDS 5.

A total of 9,469 panelists were sampled, of which 6,896 completed the survey (a completion rate of 72.8%). The cumulative weighted response rate (which takes into account not only this completion rate, but also the panel recruitment and attrition rates) for RANDS 5 was 11.1%.

This next section asks you some detailed questions about times in your life when you may have ever experienced unwanted sexual situations with anyone, including strangers or someone you knew such as a romantic or sexual partner, a family member, a friend, teacher, co-worker or supervisor, or someone you have known for only a short time. These questions are detailed and the language is explicit, which some people may find upsetting. It is important that we word the questions this way so that you understand what they mean. Your answers will help us to learn how often these things happen. You can skip questions you don't want to answer and you can stop at any time.

Sometimes sex happens when a person is unable to consent to it or stop it from happening because they were drunk, high, drugged, or passed out from alcohol, drugs, or medications. This can include times when they voluntarily consumed alcohol or drugs or they were given drugs or alcohol without their knowledge or consent. Please remember that even if someone uses alcohol or drugs, what happens to them is not their fault.

This next section asks you some detailed questions about times in your life when you may have ever experienced unwanted sexual situations with anyone, including strangers or someone you knew such as a romantic or sexual partner, a family member, a friend, teacher, co-worker or supervisor, or someone you have known for only a short time. These questions are detailed and the language is explicit, which some people may find upsetting. It is important that we word the questions this way so that you understand what they mean. Your answers will help us to learn how often these things happen. You can skip questions you don't want to answer and you can stop at any time

EINTRO1.

This next section asks you about situations in your life in which you ever experienced unwanted sex or sexual contact. This means sexual contact that you did not consent to and that you did not want to happen.

[SPACE]

Sometimes unwanted sex or sexual contact happens when a person is unable to consent to it or stop it from happening because they are too drunk, high, drugged, or passed out from alcohol, drugs, or medications. This can include times when they voluntarily consumed alcohol or drugs or times when they were given alcohol or drugs without their knowledge or consent. Please remember that even if someone uses alcohol or drugs, what happens to them is not their fault.

[SHOW IF P_NISVS=2, 3 AND GENDER=2]

You said that [INSERT DOV_FPROBEFILL_NUMB] people have [INSERT DOV_FPROBEFILL_BEHAV]. Could you please explain how you calculated or came up with that answer?

[MEDIUM TEXTBOX]

[SHOW IF ANY DOV_SECF_TOTAL_SUM > 0 AND P_PROBEEXP=2]

[SP]

PROBE_F2.

You said that [INSERT DOV_FPROBEFILL_NUMB] people have [INSERT DOV_FPROBEFILL_BEHAV]. Please think about how you calculated or came up with that answer. Which of the following strategies did you use when answering the question?

CAWI RESPONSE OPTIONS:

1. I tried to think of and count the people who have done this to me.
2. I immediately remembered the number of people who have done this to me.
3. I thought generally of how often this has happened to me and used that information to estimate.
4. I guessed.
5. I used another method to come up with my response, please specify: [TEXTBOX]

CATI RESPONSE OPTIONS:

1. You tried to think of and count the people who have done this to you.
 2. You immediately remembered the number of people who have done this to you.
 3. You thought generally of how often this has happened to you and used that information to estimate.
 4. You guessed.
 5. You used another method to come up with your response, please specify: [TEXTBOX]

NISVSCLOSE.

Thank you for participating in CDC’s study of health and injuries. We realize that some of the topics covered are quite personal and can be difficult to think and talk about. We appreciate your willingness to be a part of this study and want you to know that we recognize the important contribution you have made. Sometimes when people have participated in a study like this, they realize that they are interested in following up on some of the issues that they have been asked about in the study with someone who is professionally trained to deal with these kinds of issues.

Below are some toll-free numbers of resources that you can use now or in the future if you want to speak further with someone.

You can reach the National Domestic Violence Hotline at 1-800-799-SAFE (7233).

You can reach the National Sexual Assault Hotline at 1-800-656-HOPE (4673).

You can reach the National Child Abuse Hotline at 1-800-4-A-Child (422-4453).

You can reach the National Suicide Prevention Lifeline at 1-800-273-TALK (8255).
