

ROTENONE

5007

C₂₃H₂₂O₆

MW: 394.43

CAS: 83-79-4

RTECS: DJ2800000

METHOD: 5007, Issue 3

EVALUATION: FULL

Issue 1: 15 February 1984

Issue 3: 26 February 2016

OSHA: 5 mg/m³

NIOSH: 5 mg/m³; Group II Pesticide

PROPERTIES: solid, MP 163 °C or 181 °C; BP 220 °C @ 0.5 mm

Hg; d ca. 1 g/cm³; VP not significant

SYNONYMS: tubatoxin; cube

SAMPLING		MEASUREMENT	
SAMPLER:	FILTER (1-mm PTFE membrane)	TECHNIQUE:	HPLC; UV DETECTION
FLOW RATE:	1 - 4 L/min	ANALYTE:	Rotenone
VOL-MIN:	8 L	EXTRACTION:	4 mL acetonitrile; 30 min
-MAX:	400 L	INJECTION VOLUME:	10 µL
SHIPMENT:	routine	MOBILE PHASE:	60% methanol/40% water, 2 mL/min
SAMPLE STABILITY:	at least 7 days @ 25 °C in dark	DETECTOR:	UV @ 290 nm; 0.1A full-scale; 1-cm cell
BLANKS:	2 to 10 field blanks per set	COLUMN:	C18 (30 cm x 3.9-mm ID stainless steel); ambient temperature
BULK SAMPLE:	desirable; 1g	CALIBRATION:	solutions of Rotenone in acetonitrile
ACCURACY		RANGE:	0.04 to 1 mg per sample
RANGE STUDIED:	1 to 11 mg/m ³ [1] (100-L sample)	ESTIMATED LOD:	4 µg per sample [1, 2]
BIAS:	-0.6%	PRECISION (\bar{S}_r):	0.024 [1]
OVERALL PRECISION ($\bar{S}_{r,T}$):	0.079		
ACCURACY:	± 13.5%		

APPLICABILITY: The working range is 0.4 to 10 mg/m³ for a 100-L air sample and the method is applicable to commercial formulations.

INTERFERENCES: None known. Rotenone, a naturally occurring insecticide, is adequately separated by HPLC from other compounds (e.g., sumatrol, α-toxicarol, deguelin, elliptone, malaccol, and tephrosin [3]) present in commercial cube root extracts [4]. Rotenone is sensitive to photodecomposition.

OTHER METHODS: This is Method S300 [2] in a revised format.

REAGENTS:

1. Acetonitrile, HPLC grade.*
2. Methanol, HPLC grade.
3. Rotenone, 97% purity.
4. Water, distilled, HPLC grade.
5. Calibration stock solution, 3 mg/mL.
Dissolve 0.075 g Rotenone in 25 mL acetonitrile. Prepare fresh daily in duplicate.
6. Recovery stock solution, 50 mg/mL.
Dissolve 0.500 g Rotenone in acetone. Dilute to 10 mL. Prepare fresh daily.

*See SPECIAL PRECAUTIONS.

EQUIPMENT:

1. Sampler: 37-mm, two-piece cassette containing 1- μ m PTFE membrane filter with backup pad.
NOTE: Use an opaque cassette or otherwise shield the filter from light to minimize photodecomposition of Rotenone during and after sampling.
2. Personal sampling pump, 1 to 4 L/min, with flexible connecting tubing.
3. HPLC, UV detector, integrator and column (page 5007-1).
4. Jars, ointment, 60-mL, with PTFE-lined caps.
5. Vials, 4-mL, with PTFE-lined caps.
6. Syringes, 5-mL.
7. Filtration device, 13-mm with 1- μ m PTFE filters, or PTFE syringe filters.
8. Volumetrics, 10- and 25-mL.
9. Syringes, microliter, for sample injection and standard preparation.
10. Pipet, 4-mL, with pipet bulb.

SPECIAL PRECAUTIONS: Avoid breathing acetonitrile vapors; may cause skin irritation.

SAMPLING:

1. Calibrate each personal sampling pump with a representative sampler in line.
2. Sample at an accurately known flow rate between 1 and 4 L/min for a total sample size of 8 to 400 L. Do not exceed 2 mg total dust loading on the filter.
3. Collect a bulk sample (1 g) in a glass vial with PTFE-lined cap; ship separately from filters.

SAMPLE PREPARATION:

4. Open filter cassette; transfer filter to ointment jar.
5. Add 4.0 mL acetonitrile; gently swirl for 30 min.
6. Filter each sample using a 5-mL syringe with PTFE syringe filter or filtration device. Deliver filtrate to a 4-mL vial.

CALIBRATION AND QUALITY CONTROL:

7. Prepare at least six working standards daily in the range 0.01 to 1 mg Rotenone per sample.
 - a. Add known amounts of calibration stock solution to acetonitrile in 10-mL volumetric flasks and dilute to the mark.
 - b. Analyze together with samples and blanks (steps 9 and 10).
 - c. Prepare calibration graph (peak area vs. mg Rotenone).

8. Check recovery (R) with at least three spiked media blanks per sample set in the calibration range (step 7).
 - a. Add aliquots of recovery stock solution to blank filters with a microliter syringe. Air dry.
 - b. Analyze together with working standards (steps 4 through 6, 9 and 10).
 - c. Calculate recovery [(mg recovered - mg blank)/mg added].
 - d. Prepare recovery graph (R vs. mg Rotenone).

MEASUREMENT:

9. Set HPLC system according to manufacturer's recommendations and to conditions given on page 5007-1. Inject 10- μ L sample.
NOTE: If peak area is above linear range of calibration graph, dilute, reanalyze, and apply appropriate dilution factor in calculations.
10. Measure peak area.

CALCULATIONS:

11. Read the mass, mg (corrected for recovery) of Rotenone found on the filter (W) and average media blank (B) from the calibration graph.
12. Calculate the concentration, C (mg/m³), of Rotenone in the air volume sampled, V (L):

$$C = \frac{(W - B) \times 10^3}{V}, \text{ mg/m}^3$$

EVALUATION OF METHOD:

Method S300 [2] was issued on May 11, 1979, and validated over the range 1.16 to 11.1 mg/m³ at 25°C and 760 mm, using 100-L samples [1, 5]. Overall precision, \hat{S}_{RT} , was 0.079 with average recovery 100.4%, representing a non-significant bias. The concentration of Rotenone (generated by Wright dust feeder using Ortho Rotenone Dust [1%; Chevron Chemical Co.] enriched to 10% Rotenone with analytical grade Rotenone [Aldrich Chemical Co.]) was independently verified by collection in dioxane and HPLC analysis. Recovery was 0.98 in the range 250 to 1000 μ g Rotenone per sample. Collection efficiency of the PTFE filter was found to be greater than 99% and no detectable Rotenone (LOD = 4 μ g) was found on Chromosorb 102 tubes placed behind the PTFE filters at 11.8 mg/m³. No loss was seen from spiked filters stored in the dark at room temperature for seven days.
